Chrome Process

KI applies our bright nickel chromium finish with a 22-step cleaning, plating, and drying process. This process utilizes the brighter, more expensive, and more durable duplex hexavalent chromium plating material. In this duplex nickel plating, the crystal is denser than in standard commercial processes using a single bright nickel base application, which is used by most manufacturers.

KI's duplex process provides a plating depth more than three times thicker than single plating processes. Superior plating protects the base steel and reduces to absolute minimum any corrosion penetration that can occur with the single bright nickel processes used by others.

This system is designed to maximize water and chemical usage. There is nearly no chemical waste associated with this process. Plus, the waste that is created is sent to a reclaim facility, to recycle the waste back into its usable components.

The end result is a first-class plated product. With testing and laboratory support to manage the process, KI delivers the highest quality plated product in the industry.

Writing Tablets
